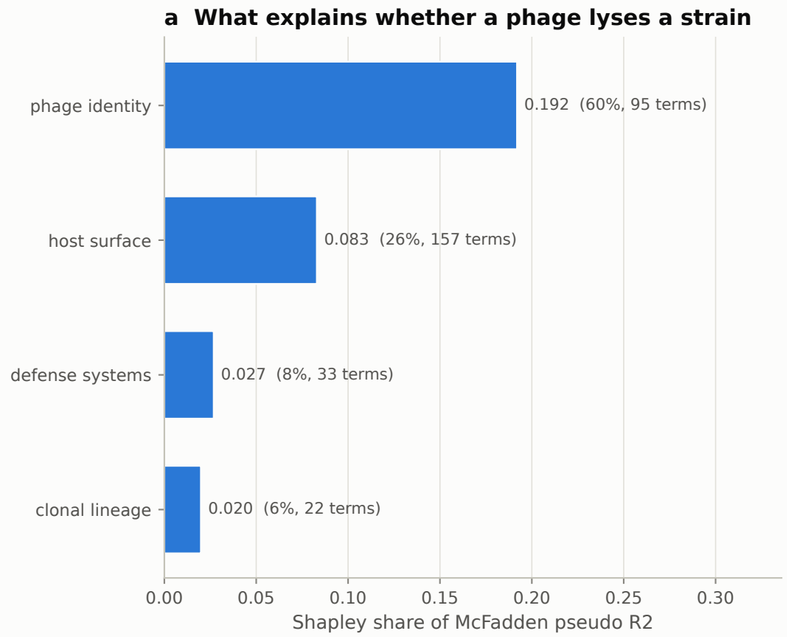
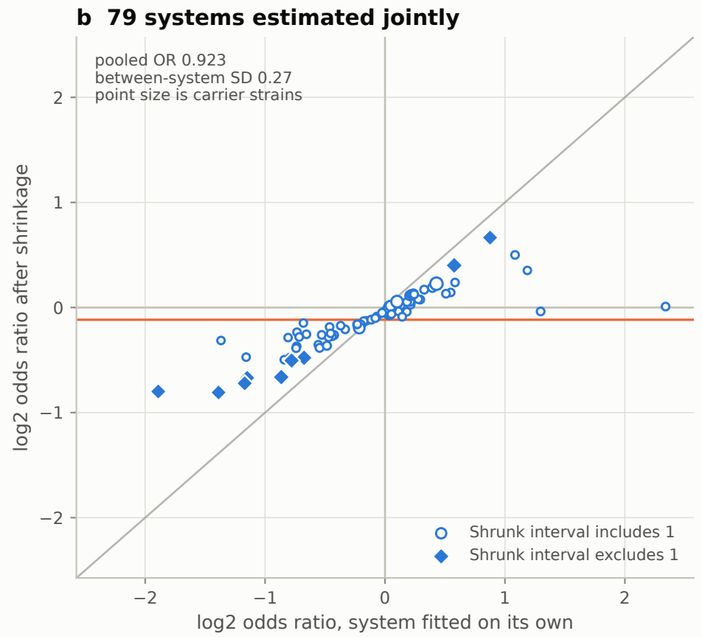
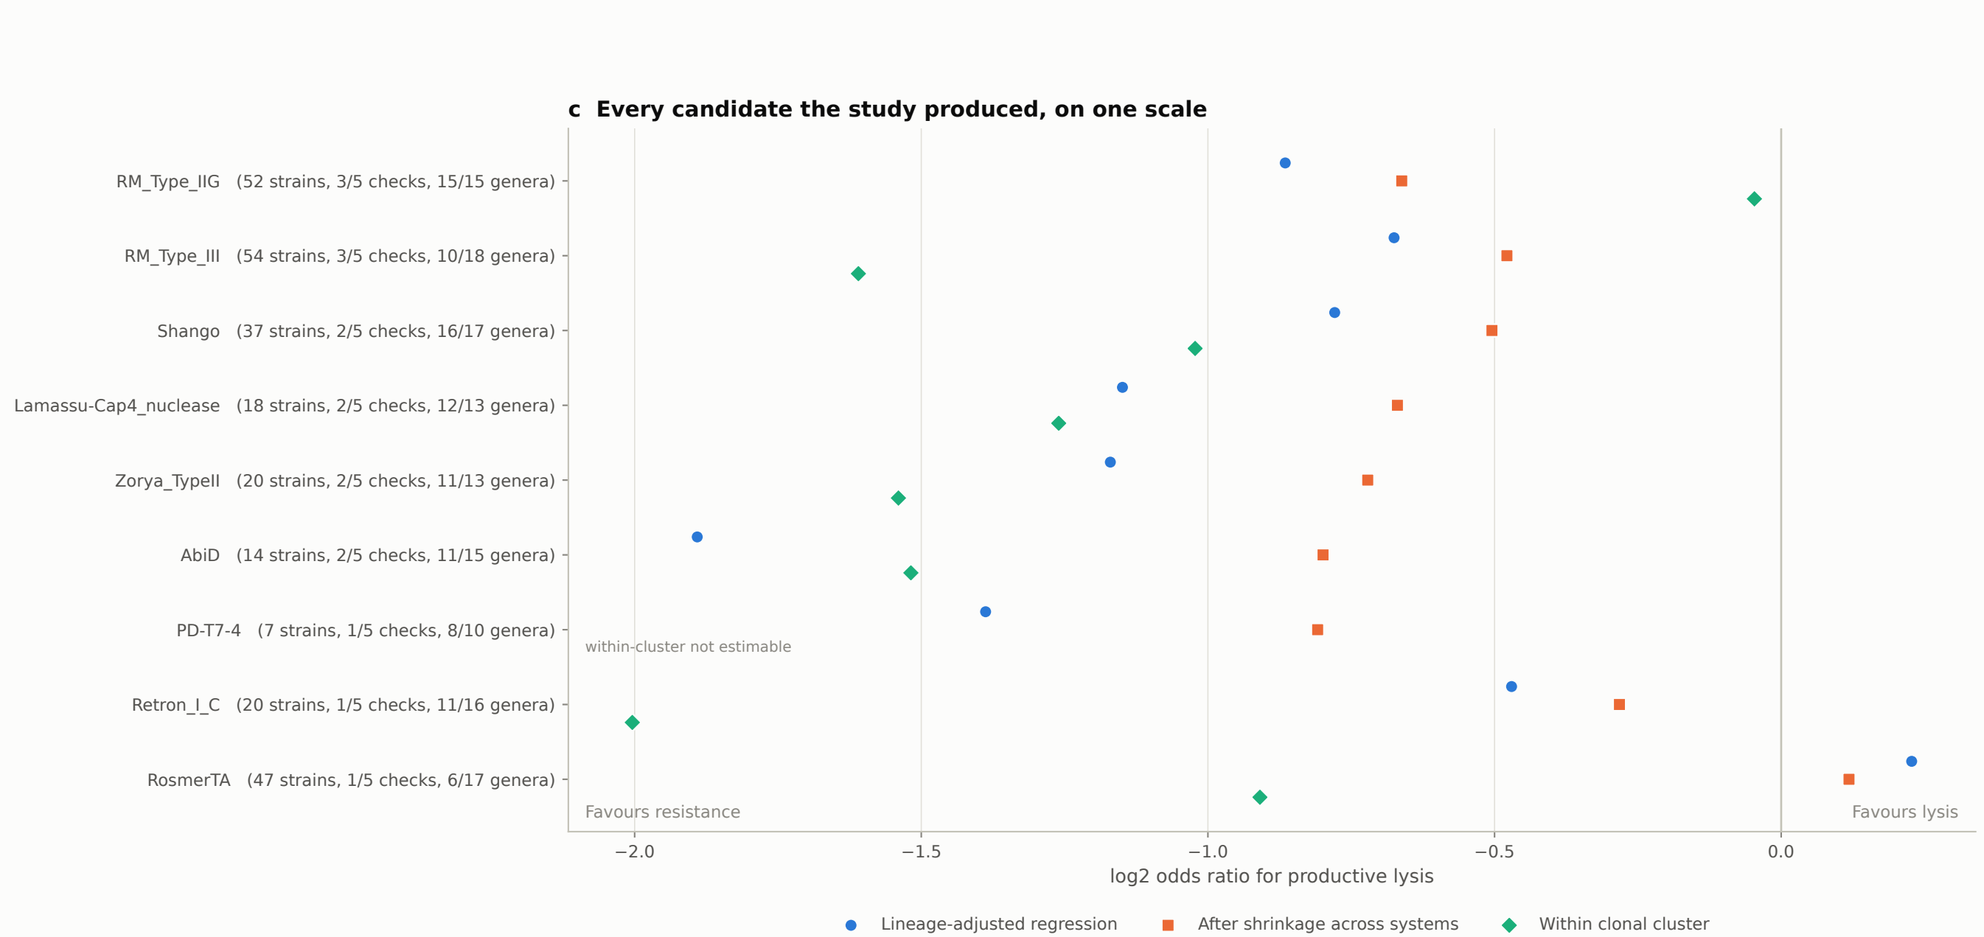
Figure 7. Host surface outweighs defense, and no candidate system survives every check






Panel a allocates explained variation by exact Shapley value, so it does not depend on the order the blocks are entered: host surface takes 0.083 against 0.027 for all 33 defense systems, reversing the impression given by the ordered decomposition in script 03. Panel b shows each system pulled toward the pooled mean in orange by an amount set by its own precision. Panel c collects every candidate nominated anywhere in the study; the best pass 3 of 5 independent checks and none passes all five.
