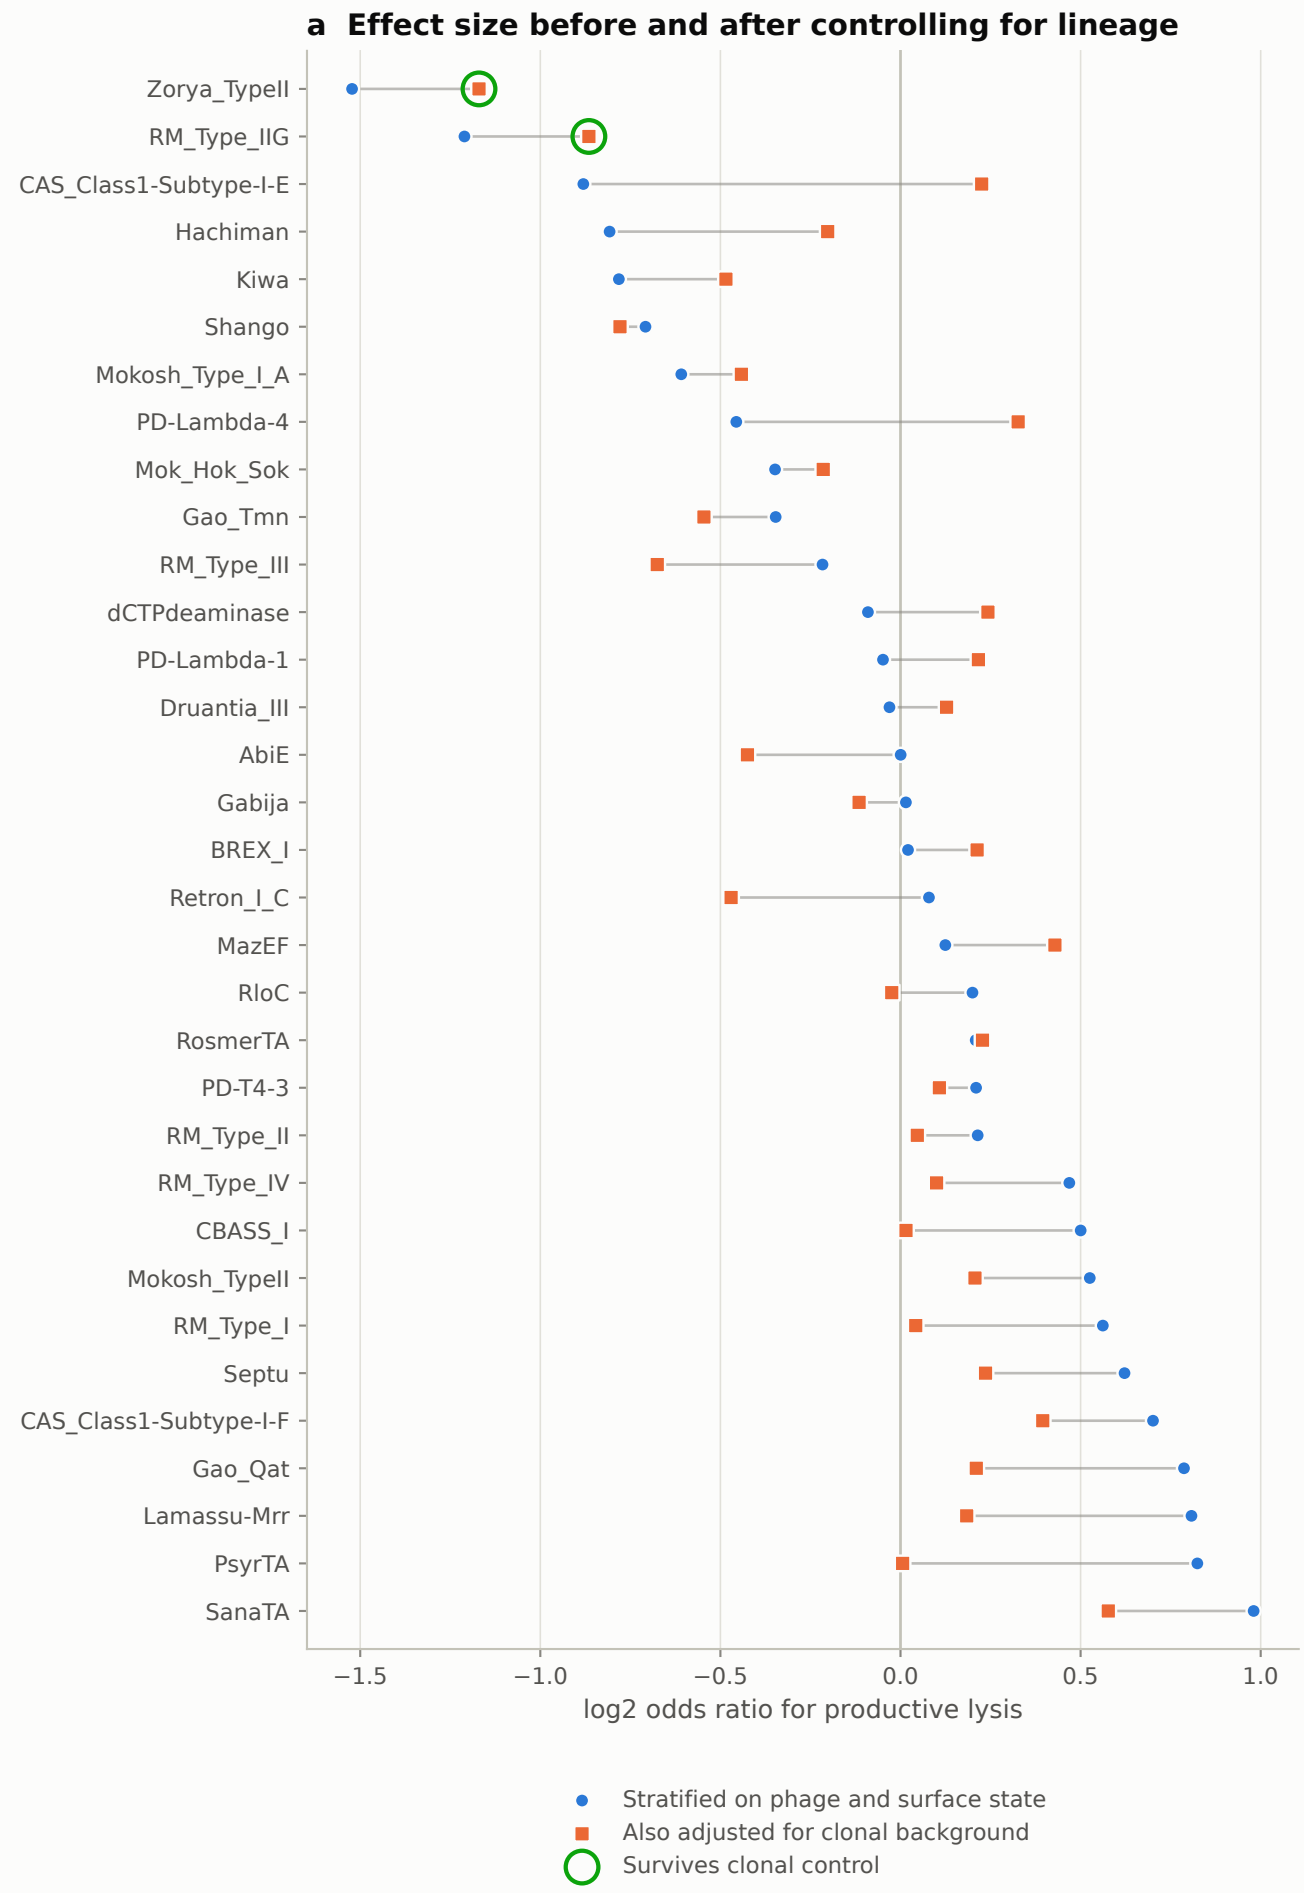
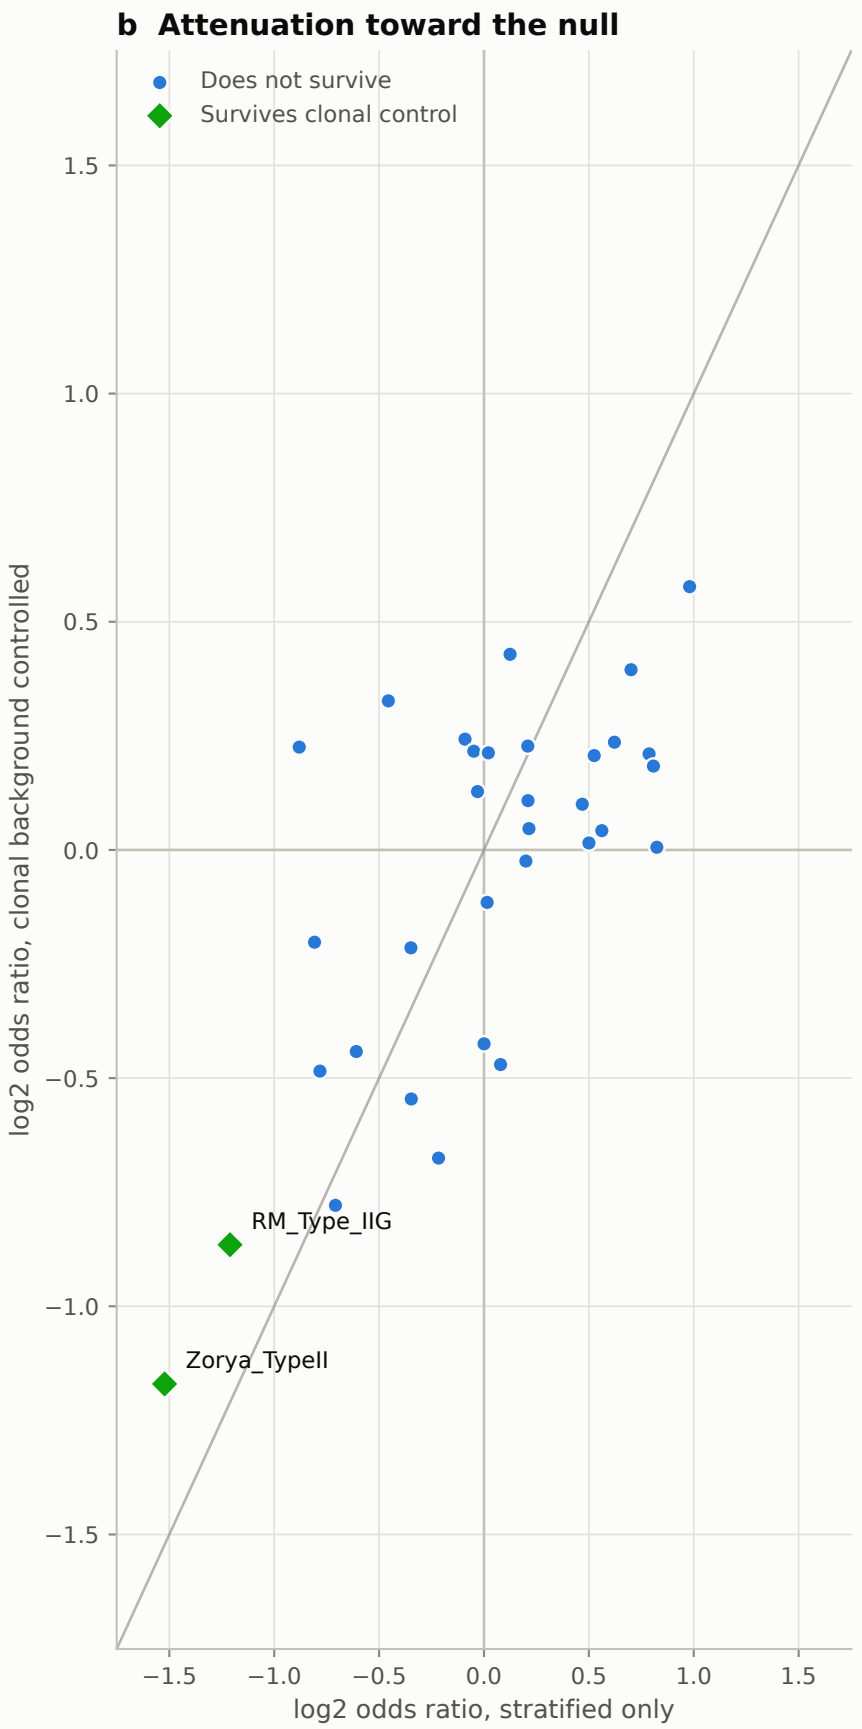
Figure 3. Almost every defense association is a property of the clonal lineage, not the system

Of 33 systems tested, 6 were significant with clustered standard errors before lineage adjustment and 2 remain after adjusting for phylogroup and eight core-genome principal coordinates. Points in panel b falling toward the horizontal axis lost their effect. The diagonal marks no change. Every association with increased lysis, which no defense mechanism can produce, disappears.





Stratified on phage and surface state
Also adjusted for clonal background
Survives clonal control
